                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-MAY-
 The fusion protein comprising the a glycosaminoglycan binding region and human superoxide dismutase, joined via a linker region was constructed according to the formula M.(2-M) -800 where Z is the peptide -YKKIIKKLESS -. The fusion protein is useful for extending the in vivo lifetimes of biologically active opds. such as SOD and for targetting them to specific cell surfaces or substrates. The glycosaminoglycan (GAG) binding protein is formed into a fusion protein with SOD to increase stability, plasma half-life and ease of purification of SOD. SOD is useful for reduction of sutoimmune diseases e.g. rheumatcid and osteo-arthritis. See also (Updated on 25-MAR-2003 to correct PN field.)

Prodn. of the intracellular protein/peptide comprises culturing bacteria contg. new gene and accumulating the peptide/protein outside the cytoplasm of bacteria. Pref. the DNA having the basic sequence coding hSOD or its deriv. obtd. by molecular cloning cDNA of hSOD derived from human liver. Advantage is that purificn. of obtd. hSOD is easily carried out and the yield of the protein is higher than using conventional method. (Updated on 10-MAR-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           99

The new human superoxide dismutase (hSOD) expression vector designated pYLBC-A/G-SOD was constructed by ligating together three fragments as follows: (1) the Nool-Sall fragment of plasmid M13mp18-SOD (E. coli LUCK-SOD-IE, FCC 10699) containing the hSOD gene and coding for a polypeptide of the present sequence; (2) the PStI-NCOI fragment from Sacharomyces cerevisiae plasmid pYLBC-A/G-HGH (KFCC 10669) containing the A/G promoter and (3) the PStI-Sall fragment of pYLBC-A/G-HGH containing the GAP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The fusion protein comprising the a glycosaminoglycan binding region and human superoxide dismutase, joined via a linker region was constucted according to the formula SOD-(M-Z)-M where Z is the peptide -EKTIRKWIK-. The fusion protein is useful for extending the in vivo lifetimes of biologically active cpds. such as SOD and for targetting them to specific cell surfaces or substractes. The glycosaminoglycan (GAG) binding protein is formed into a fusion protein with SOD to increase stability, plasma half-life and ease of purification of SOD. SOD is useful for reduction of tissue damage caused by oxygen radicals and is used in the treatment of autoimmune diseases e.g. rheumatroid and osteo-arthritis. The fusion protein comprising the a glycosaminoglycan binding region and human superoxide dismutase, joined via a linker region was constucted according to the formula SOD-(M-Z)—W where Z is the peptide -YKKIIKKLIES-. The fusion protein is useful for extending the in vivo lifetimes of biologically active cpds. such as SOD and for targetting them to specific cell surfaces or substrates. The glycosaminoglycan (GAG) binding protein is formed into a fusion protein with SOD to increase stability, plasma half-life and ease of purification of SOD. SOD is useful for reduction of tissue damage caused by oxygen radicals and is used in the treatment of autoimnume diseases e.g. rheumatoid and osteo-arthritis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The fusion protein comprising the a glycosaminoglycan binding region and human superoxide dismutase, joined via a linker region was constucted according to the formula SOD-(M-2) where Z is the peptide -KINCRLYKRANK . The fusion protein is useful for extending the in vivo lifetimes of biologically active cpds. such as SOD and for targetting them to specific cell surfaces or substrates. The glycosaminoglycan (GAG) binding protein is formed into a fusion protein with SOD to increase stability, plasma half-life and ease of purification of SOD. SOD is useful for reduction of tissue damage caused by oxygen radicals and is used in the treatment of autoimmune diseases e.g. rheumatoid and osteo-arthritis.
